

Marshfield's NEW CNC* Technology Benefits

Making our Good Product Even Better Through Advanced Manufacturing Techniques

Furniture-grade hardwood/plywood and engineered wood frame materials

- Every Marshfield frame is constructed with 7/8" furniture-grade hardwood/plywood composed of seven – 1/8" laminated. Alternating grain layers are united under pressure by a bonding agent and engineered wood to significantly reduce the chance of warping and splitting for long-lasting comfort and durability.
- More accurately cut frames allows for a better fit of frame parts.
- Ability to consistently make frame styles with more intricate design contours.
- Less assembly joints assures a stronger frame with less chance of joint noise.
- CNC accuracy considerably reduces cutting and assembly time.
- Advanced technology allows factory efficiencies to better compete with other American-made upholstery manufacturers in the marketplace **without** sacrificing the integrity of the Marshfield construction!

*Computer Numerically Controlled Technology
